

MIT International Center for Air Transportation

Interactive Electronic Flight Strips

Nathan A. Doble

R. John Hansman

JUP Quarterly Review

April 4, 2002

Motivation

- **Controller interface needed for MIT departure planner**
- **System architecture and design driven by requirements analysis**
 - ☐ Functional (controller input-output)
 - ☐ Human factors

DP Interface

Functional Requirements

- **Controller Input**

- ☐ Aircraft “ready to push” time
- ☐ Aircraft push time
- ☐ Aircraft taxi start time
- ☐ Aircraft takeoff time
- ☐ Aircraft gate location
- ☐ Current runway configuration
- ☐ Downstream constraints

- **Controller Output**

- ☐ Suggested runway configuration changes (configuration manager)
- ☐ Pushback queue and initial runway assignments (gate manager)
- ☐ Virtual runway queue and takeoff times (virtual queue and mix managers)

- **All other DP input from static databases (e.g., airport layout) or other sources (e.g., weather forecasts, airline schedules)**

DP Interface

Human Factors Requirements

- Head-up operation
- Mobility within tower cab

Observations

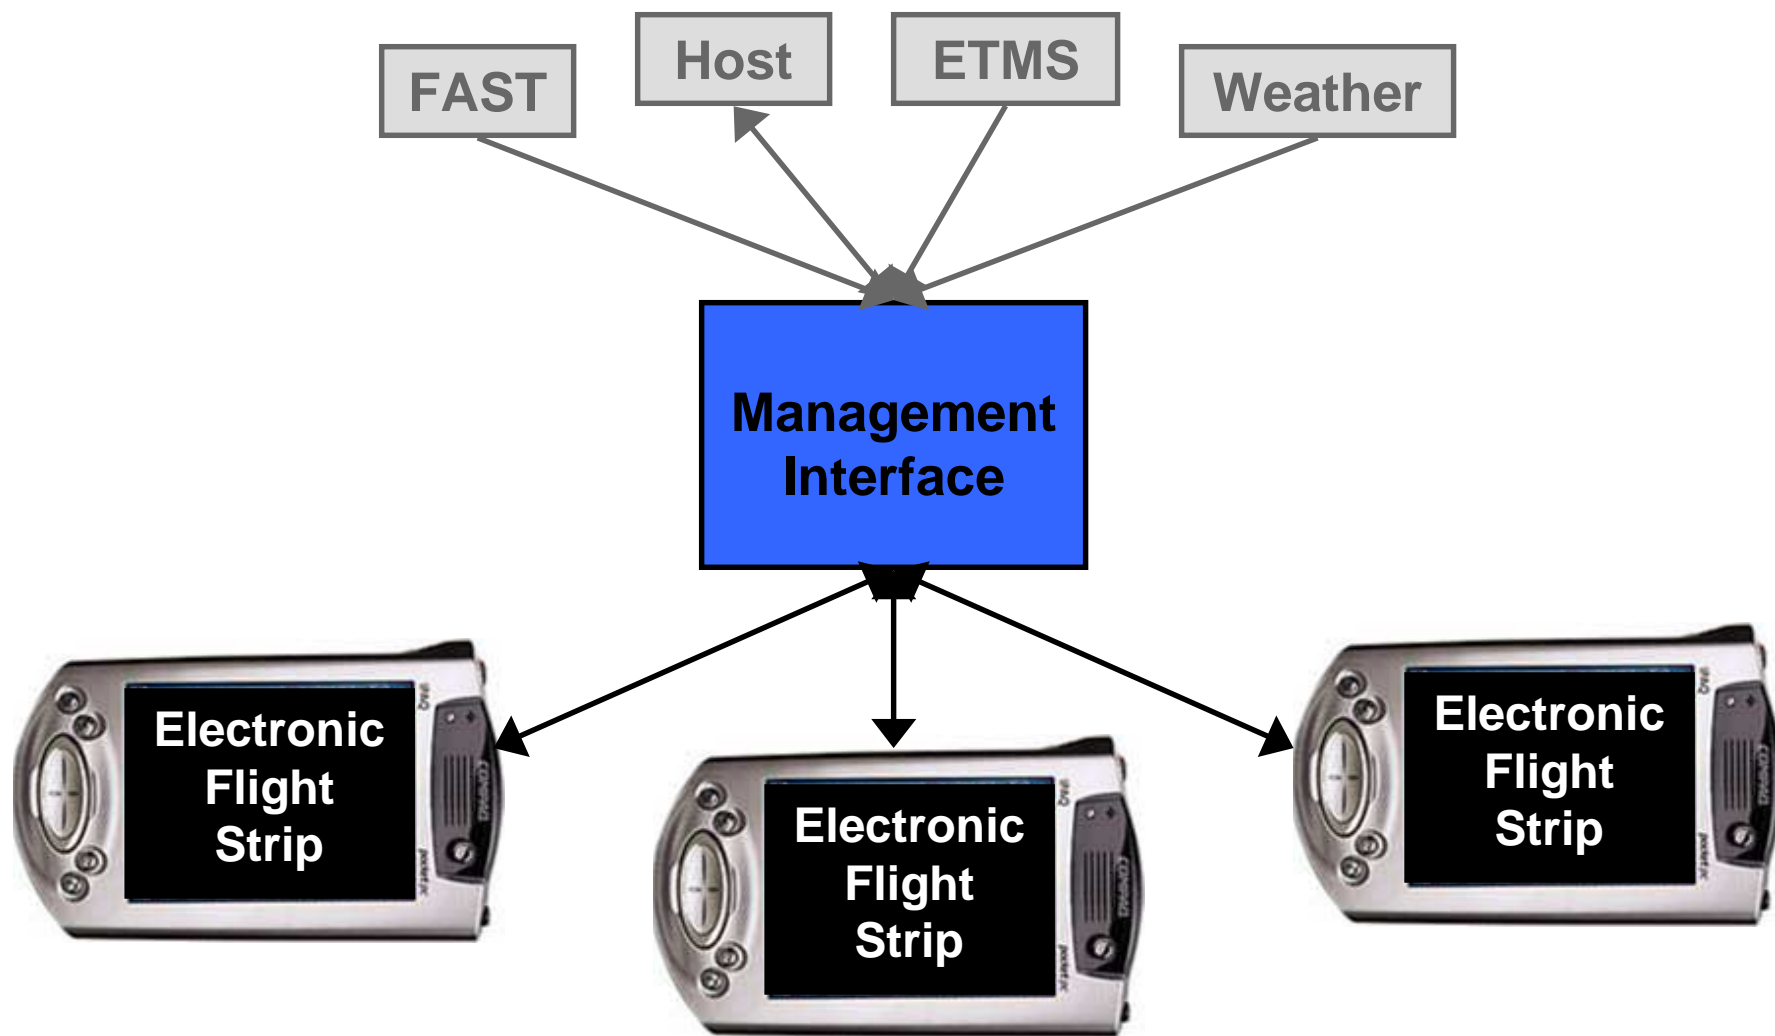

- **Some DP inputs already written on paper flight strips**
 - ☐ “Ready to push” time
 - ☐ Actual push time
 - ☐ Takeoff time
- **Some aircraft-specific DP inputs would be easy to add to a flight strip**
 - ☐ Taxi start time
 - ☐ Gate location
- **Other DP inputs and outputs better suited to centralized interface**
 - ☐ Current runway configuration
 - ☐ Suggested runway configuration changes
 - ☐ Downstream restrictions
 - ☐ Runway, Taxi, and Push queues

System Architecture Conclusions

- **To satisfy all interface functional requirements**
 - ☐ Electronic flight strip system
 - ☐ Central management interface
- **To satisfy human factors requirements of tower environment**
 - ☐ An electronic analogue of the individual paper flight progress strip, not just an electronic analogue of the strip rack
- **Solution: PDA-based electronic flight strips communicating over wireless LAN with desktop-based central management interface**

System Architecture

Design Considerations

- **Electronic flight strip must preserve functionality present in current paper departure flight strips (source: BOS Tower SOP)**
 - ☐ Changing aircraft type, altitude, route, etc.
 - ☐ Recording initial heading
 - ☐ Recording ready to push and departure times
 - ☐ Recording in-trail restrictions
 - ☐ Recording nonstandard taxi paths
 - ☐ Indicating wake turbulence waiver
 - ☐ Indicating ATIS received by aircraft
 - ☐ Indicating position and hold clearance issued
 - ☐ Writing any other nonstandard instructions
- **Other aspects of paper flight strips and strip rack that should be preserved**
 - ☐ Natural input method (handwriting)
 - ☐ Handoffs completed by physically transferring strip from controller to controller
 - ☐ Ability to sort flights in strip rack

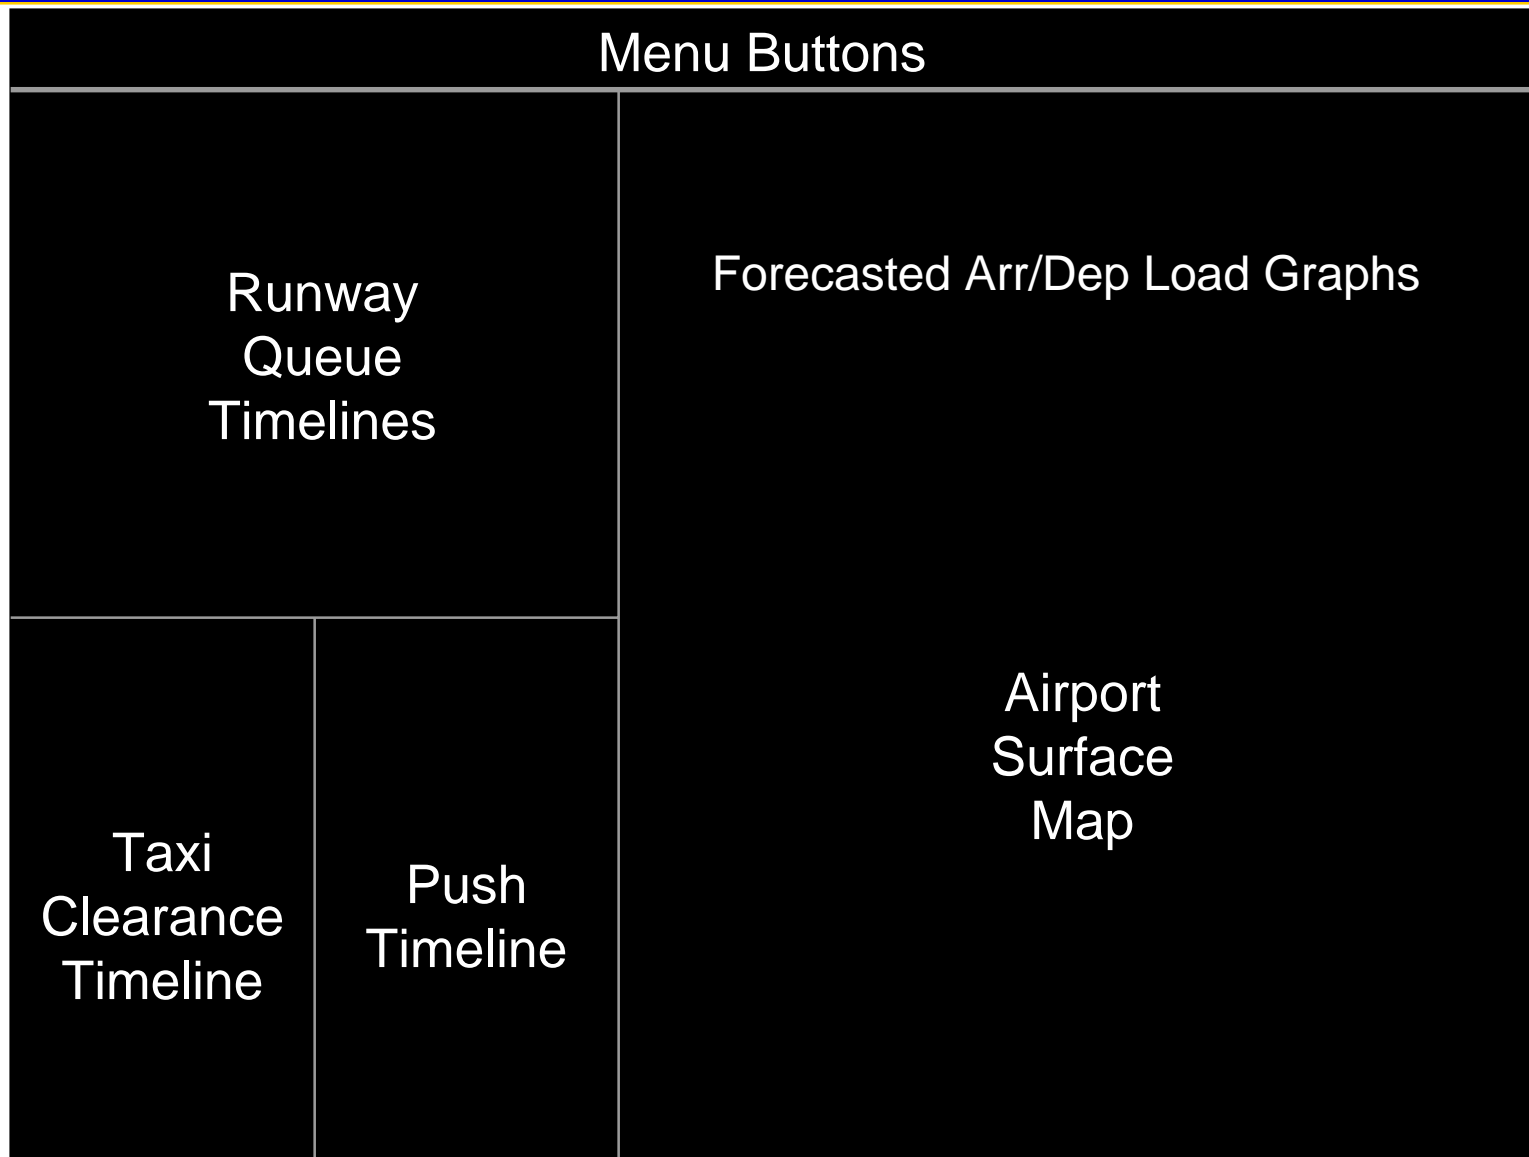

Design Considerations (2)

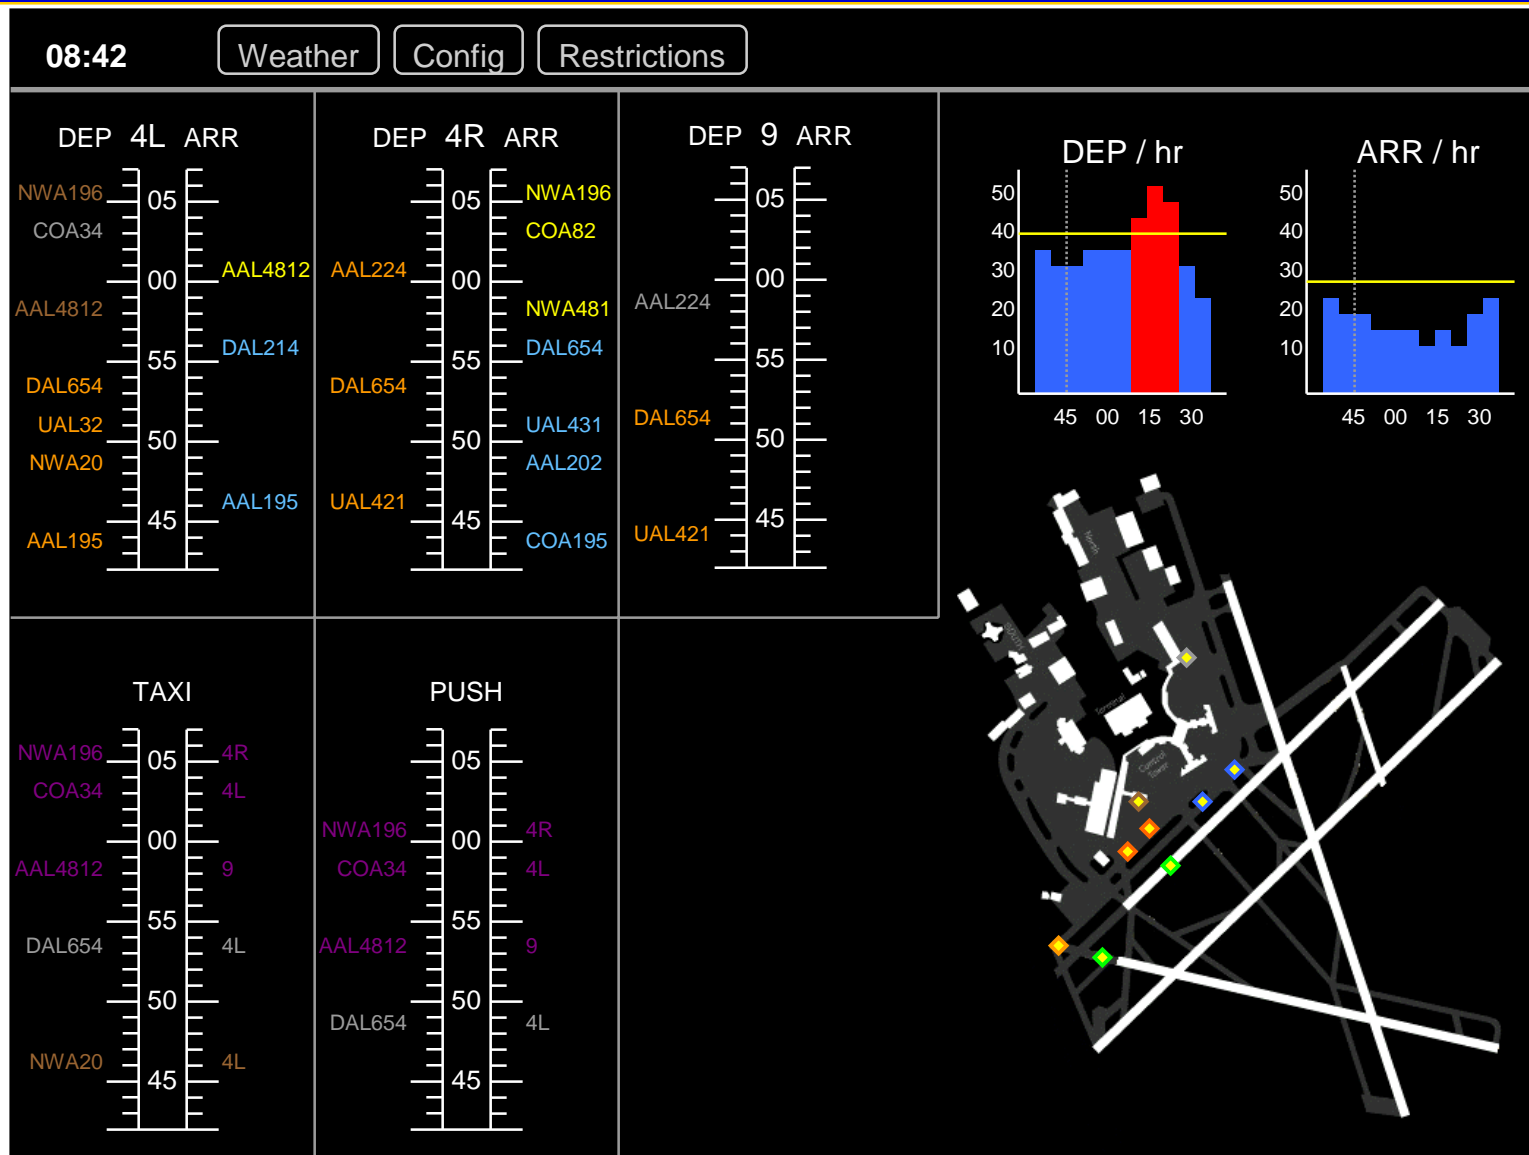

- **Although not required by DP or current flight strip procedures, electronic interface would allow additional features**
 - ☐ Customized views for each controller position
 - ☐ Airport surface map
 - ◆ Aircraft positions
 - ◆ Taxi clearances
 - ◆ Runway assignments
 - ☐ Runway incursion alerting
 - ☐ Weather information
 - ☐ Performance metrics
 - ☐ Trial planning for virtual runway queue

Issues

- **Absolute vs. differential time**
- **Color conventions**
 - If runway incursion information included, possible conflicts between standard aviation display color coding and paper flight strip coloring, timeline color-coding
- **Flight strip position determination**
 - In order to perform automated handoffs or automated sorting with the strip rack, some position information must be known
 - Instrumenting the strip vs. instrumenting the strip rack
 - ◆ Prigge & How: Dipole magnetic fields to track (x,y,z) position of flight strip, centimeter accuracy shown
 - ◆ Mackay: Resistors on flight strips to determine position on strip rack

Current Progress

- **PDA and wireless LAN hardware purchased**
- **Test application running on PDAs**
 - ☐ Runs full-screen
 - ☐ Basic line drawing and text printing (portrait only) functions
 - ☐ Accepts stylus input
 - ☐ Controls hardware buttons
 - ☐ Sends and receives messages via wireless LAN
 - ☐ Handwriting recognition not yet enabled

Future Work

- **Finish coding initial design of flight strips and management interface**
- **Solicit input on interface from Boston Logan controllers**
- **Revise design based on controller input**
- **Evaluate controller performance with electronic flight strips**
